# PROJECT REPORT

# Task 14 – Basic Sales Summary

**Track:** Data Analytics  **Tool:** Microsoft Excel

## 1. Introduction

This task demonstrates how to prepare a basic sales summary in Excel. The work uses a small retail-style transaction dataset and applies spreadsheet formulas to calculate three key performance indicators (KPIs): total sales, average sales, and transaction count.

## 2. Objective

To summarize transaction-level sales data, use Excel formulas correctly, and present the results in a clear Summary sheet.

## 3. Dataset Used

Dataset type: **synthetic sample retail sales dataset**, created for practice because no original Veda Technology dataset was attached to the task screenshot. It contains 100 illustrative transactions dated September–October 2026. Products include stationery, accessories, home items, and electronics. This is not an official Veda Technology dataset.

| Column | Description |
|---|---|
| Transaction ID | Unique identifier for each transaction |
| Date | Transaction date |
| Product | Product purchased |
| Category | Product category |
| Quantity | Units sold |
| Unit Price (INR) | Price per unit in Indian rupees |
| Sales (INR) | Quantity multiplied by unit price |

## 4. Methodology

1. Review the transaction records in the Sales Data sheet.
2. Calculate Sales for each row as Quantity × Unit Price.
3. Use SUM to calculate total sales.
4. Use AVERAGE to calculate average sales per transaction.
5. Use COUNTA on Transaction ID to count transactions.
6. Check the outputs and format currency values as Indian rupees.

## 5. Excel Formulas

| KPI | Formula |
|---|---|
| Total Sales | =SUM('Sales Data'!G2:G101) |
| Average Sales | =AVERAGE('Sales Data'!G2:G101) |
| Transaction Count | =COUNTA('Sales Data'!A2:A101) |
| Sales per row | =Quantity * Unit Price |

## 6. Results

| KPI | Calculated result |
|---|---|
| Total Sales | ■161,866.55 |
| Average Sales | ■1,618.67 |
| Transaction Count | 100 |
| Total Quantity (additional check) | 455 units |

## 7. Conclusion

The task shows how basic Excel formulas can turn transaction-level records into a quick business summary. Total Sales shows the overall sales value, Average Sales shows the typical transaction value, and Transaction Count indicates how many transactions were recorded. For final submission, replace the illustrative sample dataset with the official dataset if Veda Technology has supplied one.

## 8. Interview Questions

**What is a KPI?** A Key Performance Indicator is a measurable value used to monitor progress or performance against a goal.

**How is average different from total?** Total adds all values together. Average is the total divided by the number of values.

*Prepared as a learning-task report. Dataset is synthetic and for practice only.*
